

Guidance Menu

This function covers widely from simultaneous 2-axis machining such as the circular arc and oblique to contour machining. It can also calculate the centering measurement position and the cutting conditions.

No programming is required!

- Choose a function and input numerical values.
- Easy-to-follow guidance function.
- Two screens of guidance machining data can be stored.
- The Z-axis limit function prevents over-cutting.
- Z-axis automatic cutting allows pocket/side/flat machining.

Interpolation

Datum point memory (4 points)

Drilling

Boring

Pattern

- Boring has 4 options available for selection

Measurement (Centering)

End face

Waypoint

Central point

Angle

Playback

- Conducts machining in succession as programmed during the teaching function.
- Allows verification of the process with its graphic display.
- Corresponds to rotational transfer. (Input the angle and central position to machine at the specified angle)

Cutting conditional calculation

- Displays the tool rpm and feed rate.

Guidance Functions Options

Contour

Contour machining

- A maximum of 41 intersections can be entered by specifying the linear and circular interpolations.
- The finished dimension is adjustable by offsetting an amount equal to the radius of tool.
- Choice of downcut or upcut is available.
- Function exists to change the coordinates of input data. (Coordinate reversal, moving coordinate or data bulk removal)

Contour program

- Displays graphics for each creation.
- Calculates intersections automatically.
- Calculates ending coordinates.
- Calculates the central coordinate of a circle.
- Offset positions are available.
- Graphic displays (enlarged, reduced or actual size).
